Subject: Nintendo Switch Controller malfunction.

Nintendo:

During the past few months, several times I have been purchasing your controllers for the Nintendo Switch console but all of them malfunction. In this email I want to briefly describe the problem and recommend a method of solving it.

In the last 5 months I bought 6 Nintendo switch controllers and all of them after several weeks of use, malfunction. The characters in the games start to move by themselves, ruining the game experience. The problem with these controllers is the drift on the joy-sticks, which is caused by the dust and grime building up inside the control stick mechanism.

To prevent this problem, I suggest producing a better way to prevent the dust from going inside the mechanism. Also evaluating your product for several months would help in the prevention of any other kind of malfunction.

Thank you. Please contact me at (737)-231-5418 or catomoco@icloud.com if you have any questions.

Best Regards,
Angel Ramirez.

Dear Mr. Ramirez:

Thank you for writing to us about the Nintendo switch malfunction on February 19, 2024. I understand the frustration of and the bad game experience when a controller malfunctioned.

Our best technicians and engineers are working and developing a better mechanism to prevent dust from entering the joystick. Also, we are implementing a 3 to 6-month test on all our products before releasing them onto the market.

I realize I cannot undo the technical malfunction of the controllers you bought and the frustrating gaming hours you went through. To make up for the issues that you have been having with our products, let me offer you a warranty for all the malfunction controllers you bought.

Your suggestions and comments are heard from everyone here at Nintendo of America. Thank you for being a great customer and I hope you enjoy the rest of our products.

Sincerely,

A stylized, handwritten signature in black ink, appearing to read "Doug Bowser".

Subject: Implementation and creation of new mechanism in Joy-cons.
Date: February 20, 2024

The purpose of this memo is to present the new implementation of testing and the creation of new mechanisms for our Joy-cons controller.

Summary

In general, we would add a new policy that executes a 3 to 6-month test on all our products before releasing them onto the market, and we would be developing a new anti-dust mechanism for our Nintendo switch controllers.

Discuss of Product Options

Recently, we have been receiving complaints about the control of the Nintendo Switch. The problem that our customers have had is the malfunction of the Joystick. Dust and grime building up inside the control stick mechanism have been the cause of this problem. All that protects the joystick component from outside agents, like dust particles or grime, is a thin flap of soft plastic. If that flap is lifted, even briefly during gameplay, all sorts of stuff could get inside the controller and ruin functionality. To avoid these malfunctions, it is necessary for engineers and technicians to produce a solution and implement it in the controller.

We will also add a policy that executes a 3 to 6-month test on all our products before releasing them onto the market. This will help us to:

- Ensure that the product is fit for the purpose.
- Identify any potential design or manufacturing flaws.
- Uncover any user experience issues.
- Boost confidence in the product.
- Improve chances of success.
- Reduce the risk of failure.

Evaluating our products before launch is an essential part of the product development process, and can save a lot of time, money, and headaches in the long run.

Recommendations

To avoid more issues please be detailed in every aspect of these new implementations, both the new mechanism of the controller and policy. I think we should speak with Shuntaro Furukawa and Takashi Tezuka to participate in the discussion. Give me a call (x3442) and we'll talk.
